

OS-A03 Professional Obligations

Executive brief for statistical leaders

Decision. An AI-assisted statistical workflow is acceptable only within verified authority, an approved information environment, an explicit quality threshold and an accountable human review route. The module teaches staff to apply impartiality, confidentiality, transparency, quality and accountability to contested decisions. Its required product is a professional judgement memorandum.

Why this matters

A fluent draft may misstate a trend, invent a policy clause or reveal protected information. A faster workflow may also move effort from drafting to verification. Leaders need decision records that show what the system did, which evidence the statistician checked, who may authorize release, and when work must stop.

Obligation	Leadership question	Non-negotiable control
Impartiality	Could pressure, selective framing or unequal access change the statistical message?	Statistical authority controls methods and release.
Confidentiality	May these data enter this service, including prompts, logs and retrieval stores?	Classify first and use an approved environment.
Transparency	Can users understand sources, uncertainty, revisions and material AI assistance?	Preserve provenance and explain consequential limitations.
Quality	Does the product meet its intended use for affected groups?	Apply an independent benchmark and stopping rule.
Accountability	Who owns the decision, safeguards, incident response and corrections?	Assign decision and review authority to named people.

Required decision record

The memorandum identifies purpose and owner; verified facts and authorities; excluded information; obligations and affected groups; viable options including delay; independent verification; a disposition of **accept, condition, restrict, reject or escalate**; safeguards with owners and due dates; a stopping rule; review triggers; and measured baseline versus assisted time if an efficiency claim is made.

Leadership action: authorize a bounded synthetic pilot, approve local policy references and tools, assign the release and data stewards, and require a review of failure cases before operational use. The notebook's policy references P01-P03 are placeholders, not applicable law.
