

OS-A03 Professional Obligations

Learner and facilitator guide

Learning outcome and product

Given a contested AI-assisted official-statistics scenario, identify responsible authorities, distinguish verified evidence from claims, classify information, compare a conventional and an assisted analysis under one quality standard, challenge AI reasoning, and deliver a defensible **professional judgement memorandum**.

Before the laboratory

Read canonical lesson chapters 1–18. Prepare a local copy of the v0.2 notebook and the accompanying Quick Guide. Use synthetic Kintaba cases only. Confirm the notebook's `outputs/` location is writable. The deterministic assistant demonstrates a workflow; it does not validate an AI service. Do not insert real confidential records.

Guided sequence

1. **Frame the decision.** State users, purpose, consequence, decision owner and excluded actions.
2. **Baseline first.** Analyze a case without looking at the simulated AI suggestion. Record facts, obligations, alternatives, disposition, confidence and measured active minutes for analysis, review and rework.
3. **Screen information.** Record each field as permitted, minimized, transformed or excluded. Verify service approval and retention rules before any operational AI interaction.
4. **Specify the task.** Request issue extraction, obligation mapping, missing evidence, counterarguments and a draft structure. Prohibit fabricated authority and delegation of final judgement.
5. **Verify independently.** Trace each material claim to a supplied source; local policy placeholders remain unverified. Check omissions, uncertainty, affected groups and confidentiality risk.
6. **Decide and document.** Complete all five obligation fields and issue one of the five dispositions. Assign every safeguard an owner, deadline and completion evidence.
7. **Compare fairly.** Record actual assisted generation, verification and rework minutes. A positive time difference counts only if both routes pass identical quality checks and have no critical failure.
8. **Transfer cautiously.** Propose a localized intake form, authority register, information screen, verification checklist and review schedule for an authorized workplace pilot.

Reading notebook outputs

JSON is a structured record with field names and values. `missing` lists sections still to complete. `ready_for_approval` checks completeness only; it cannot approve the reasoning. `unverified_sources` marks institutional rules that need an authoritative source. `claim_allowed: false` blocks an unsupported positive efficiency claim. `CANDIDATE.json` is a draft evidence record.
